

SMART PANTRY MANAGER

Objective:

Make a responsive website

Problem:

Many households struggle with food waste, inefficient grocery shopping, and meal planning due to poor visibility of pantry inventory. Users often:

- Forget what items they already own, leading to duplicate purchases.
- Miss expiry dates, resulting in spoiled food.
- Struggle to decide what meals to cook based on available ingredients

Proposed Solution:

An application that:

- Tracks pantry items (via barcode scanning or manual entry).
 - Item name
 - Manufacturing date

- Expiry date
- Sends expiry alerts to reduce food waste.
- Recommends recipes based on available ingredients.

Functional Requirements:

1. User Management

- Register/login with email or social auth.
- Set dietary preferences (vegan, gluten-free, etc.).

2. Pantry Inventory Management

- Add/remove items (manual entry or barcode scan).
- Track quantity and expiry dates.
- Categorize items (e.g., "Grains," "Dairy").

3.Expiry Alerts

- Notify users via email/app when items near expiry.
- Suggest recipes to use soon-to-expire items.

4.Meal Recommendations

- Match pantry items with recipes from a database.
- Filter by dietary preferences, cooking time, etc.

Non-Functional Requirements:

1.Performance

- Load recipe recommendations in <2 seconds.

2.Usability

- Intuitive UI (minimal clicks for frequent actions).

3. Security

- Encrypt user data (credentials, pantry inventory).

4. Compatibility

- Work on mobile (PWA) and desktop.

Web app screens.

1. Landing page (index page) - **kevin**
2. Login/register screen - **rocliff**
3. Pantry management page - **godfrey/kevin**
4. Meal recommendations- **sankok**
5. User account management page - **Alex**

- Design the frames for the web app
- After the OOP presentation on Monday, we focus on the HTML and CSS files. We shall write this code together but later work will be distributed. A Github repo for this will be set up.
